COMMENT ON R. S. VAILE'S DISCUSSION OF UTAH RESULTS.

F. S. Harris.¹

In his discussion of irrigation experiments at Utah, Professor Vaile lays much emphasis on the need of giving proper consideration to the crop-producing power of the natural precipitation independent of the irrigation water applied. He shows a method of arranging the irrigation data in a way that will help the user of water to decide how much to apply as a supplement to dry farming. His method of arranging the material is interesting just as any additional way of presenting facts brings out interesting relations. Many such ways of arranging our material have presented themselves to us, but have not
