BOOK REVIEW.

Methods of Teaching Vocational Agriculture in Secondary Schools.
By Samuel H. Dadisman, Supervisor of Teacher Training Classes, University of California. Richard G. Badger, Publisher. 142 pp. 1922.

This is a text and reference book in vocational agriculture which should prove extremely useful to every teacher trainer, prospective teacher and teacher of agriculture. Professor Dadisman recognizes the fact that most of the shortcomings in the teaching of agriculture in secondary schools in recent years, have been due to inadequate preparation on the part of the teachers. He, therefore, undertook to prepare a book on "Methods of Teaching Vocational Agriculture" which definitely points out the way to more successful teaching in this field. We are confident that he has been very successful in his undertaking. In our judgment, every one who is connected in any way with agricultural educational work, will find this little volume very helpful and stimulating.

The Chapter on, "The Home Project" is especially valuable as is also the one dealing with "Planning the Lesson and Lesson Plans." Many teachers will find Professor Dadisman's outlines for a four year course in secondary agriculture very helpful and suggestive.

The book also contains much interesting material on the development of agricultural education and cooperative rural organizations, which is well worth reading. (W. H. Stevenson.)
