CORRELATED INHERITANCE IN A CROSS BETWEEN
DICKLOW X SEVIER WHEAT

GEORGE STEWART

This paper reports a study of the inheritance and the correlated inheritance of observed and measured characters in a cross between a pure line of Dicklow and a pure line 121 of Sevier. In view of the fact that the literature relative to the characters studied in this cross have been previously reviewed several times, all reference to literature is omitted here.

Dicklow is one of the leading spring wheats on irrigated farms in Utah and Idaho. The spikes are beaked, with short apical awns, and the glumes are white in color. The spikes are of intermediate density with a tendency to be clavate at the apex. The origin of Sevier is not
