Supplementary Materials

*Analysis of interannual variation by state*

Above, figure S1 indicates patterns in interannual variation in the CCYP and CSYP. As a raw percentage, the CCYP is the greatest in 2012 in four of the six states though only significantly greatest in one after correction for multiple comparisons, and is significant overall in 23 out of 30 state-years. Below, patterns in the effect in raw bushel/acre terms (Figure S2) show a similar pattern to those in percentage terms.
Number of samples/fields by Crop Reporting District

Figure S3, above, shows the number of samples by Crop Reporting District.
