Registration of ‘H1215’ Cotton

‘H1215’ cotton (Gossypium hirsutum L.) (Reg. no. CV-112, PI 578225) was developed by the Louisiana Agricultural Experiment Station (LAES). In 1991, marketing rights to H1215 were licensed exclusively, through a competitive bid process, to Jacob Hartz Seed Co., Inc., of Stuttgart, AR. This cultivar, along with sister cultivars H1220 (2) and H1244 (3), is unique in commercial upland cotton in that it possesses a high frequency of gossypol glands on the calyx crowns of flower buds, a trait that confers considerable resistance to the cotton bollworm [Heliothis virescens (F.)] and tobacco budworm [Helicoverpa zea (Boddie)] and is unique in commercial upland cotton exclusively, through a competitive bid process, to Jacob Hartz Seed Co., Inc., under the designation LA870206. In 1992, H1215 was entered in state cultivar trials by Jacob Hartz Seed Co., Inc., under the designation HX 1406.

H1215 originated from a cross between Miscot T8-27 (1) and La. HG-063 (4), made in 1985 by J.E. Jones of the LAES. The F1 of Miscot T8-27/La. HG-063 was grown in Tecoman, Mexico, in the winter of 1985–1986 and seed were bulk-harvested. In 1986, the F2 was grown at Baton Rouge, LA, and seed from plants exhibiting gossypol glands on their calyx crowns were harvested in bulk. The F3 was again grown in Mexico in 1986–1987 and was harvested as an unselected, selfed bulk. The F4 was grown at St. Joseph, LA, and plants exhibiting gossypol glands on calyx crowns were harvested individually. Progeny rows from the selected plants were grown again at St. Joseph in 1988; the F5 progeny row from F4 plant selection LA870206 was bulk-harvested and later designated H1215. Seed was increased without further selection, except to remove obvious offtypes.

Averaged over 13 location-years in Louisiana from 1989 to 1992, H1215 produced 25 and 20% higher lint yields than ‘Deltapine 41’ and ‘DES 119’, respectively. In state cultivar trials in Arkansas in 1992 (mean of six locations), H1215 produced 16% higher lint yields than ‘Deltapine 50’ (DP 50) and 9% higher than DES 119. In Mississippi cultivar trials in 1992 (mean of four Delta locations), H1215 produced 11% more lint than DP 50 and 8% more than DES 119. In state tests in 1993, H1215 outyielded both DP 50 and DES 119 in Arkansas by 10% (mean of six locations), in Louisiana by 5% (mean of five locations), and in Mississippi by 16% (mean of four locations).

Seed gossypol content in H1215 is somewhat higher than in most cultivars currently available. Total seed gossypol content of H1215 from Mississippi state cultivar trials was 0.81%, compared with 0.77% for DP 50, 0.63% for ‘Suregrow 125’, and 0.89% for ‘Stoneville 474’.

Micronaire reading and fiber length of H1215 were slightly higher than DES 119, while fiber strength and elongation were similar. Seed index and boll weight were 10 to 15% higher than DES 119.

The sister cultivars H1215, H1220, and H1244 are similar in many respects; e.g., all have normal-shaped leaves with sparse hairs, similar gossypol content, and similar gossypol gland frequency and frequency. In addition, this cultivar has been consistently high yielding and has produced good quality fiber.

H1215 was tested from 1989 through 1991 by the LAES under the designation LA870206. In 1992, H1215 was entered in state cultivar trials by Jacob Hartz Seed Co., Inc., under the designation HX 1406.

Registration of ‘H1220’ Cotton

‘H1220’ cotton (Gossypium hirsutum L.) (Reg. no. CV-113, PI 578226) was developed by the Louisiana Agricultural Experiment Station (LAES). In 1991, marketing rights to H1220 were licensed exclusively, through a competitive bid process, to Jacob Hartz Seed Co., Inc., of Stuttgart, AR. This cultivar, along with sister cultivars H1215 (2) and H1244 (3), is unique in commercial upland cotton in that it possesses a high frequency of gossypol glands on the calyx crowns of flower buds, a trait that confers considerable resistance to the cotton bollworm [Helicoverpa zea (Boddie)] and tobacco budworm [Heliothis virescens (F.)] (5). In addition, this cultivar has been consistently high yielding and has produced good quality fiber.

H1220 originated from a cross between Miscot T8-27/La. HG-063 (4), made in 1985 by J.E. Jones of the LAES. The F1 of Miscot T8-27/La. HG-063 was grown in Tecoman, Mexico, in the winter of 1985–1986 and seed were bulk-harvested. In 1986, the F2 was grown at Baton Rouge, LA, and seed from plants exhibiting gossypol glands on their calyx crowns were harvested in bulk. The F3 was again grown in Mexico in 1986–1987 and was harvested as an unselected, selfed bulk. The F4 was grown at St. Joseph, LA, and plants exhibiting gossypol glands on calyx crowns were harvested individually. Progeny rows from the selected plants were grown again at St. Joseph in 1988; the F5 progeny row from F4 plant selection LA870206 was bulk-harvested and later designated H1220. Seed was increased without further selection, except to remove obvious offtypes.

Averaged over 13 location-years in Louisiana from 1989 to 1992, H1220 produced 25 and 20% higher lint yields than ‘Deltapine 41’ and ‘DES 119’, respectively. In state cultivar trials in Arkansas in 1992 (mean of six locations), H1220 produced 16% higher lint yields than ‘Deltapine 50’ (DP 50) and 9% higher than DES 119. In Mississippi cultivar trials in 1992 (mean of four Delta locations), H1220 produced 11% more lint than DP 50 and 8% more than DES 119. In state tests in 1993, H1220 outyielded both DP 50 and DES 119 in Arkansas by 10% (mean of six locations), in Louisiana by 5% (mean of five locations), and in Mississippi by 16% (mean of four locations).

Seed gossypol content in H1220 is somewhat higher than in most cultivars currently available. Total seed gossypol content of H1220 from Mississippi state cultivar trials was 0.81%, compared with 0.77% for DP 50, 0.63% for ‘Suregrow 125’, and 0.89% for ‘Stoneville 474’.

Micronaire reading and fiber length of H1220 were slightly higher than DES 119, while fiber strength and elongation were similar. Seed index and boll weight were 10 to 15% higher than DES 119.

The sister cultivars H1215, H1220, and H1244 are similar in many respects; e.g., all have normal-shaped leaves with sparse hairs, similar gossypol content, and similar gossypol gland frequency. In addition, this cultivar has been consistently high yielding and has produced good quality fiber.

H1220 was tested from 1989 through 1991 by the LAES under the designation LA870206. In 1992, H1220 was entered in state cultivar trials by Jacob Hartz Seed Co., Inc., under the designation HX 1406.
