REGISTRATIONS OF CULTIVARS

Registration of ‘Oklee’ Wheat

‘Oklee’ is a hard red spring wheat (Triticum aestivum L.) (Reg. no. CV-963, PI 634553) developed and released by the Minnesota Agricultural Experiment Station in cooperation with USDA-ARS in January 2003. It was named after a town in its region of adaptation in northwest Minnesota. Oklee was released on the basis of its high grain yield, high grain volume weight, high grain protein content, and early maturity. In addition, Oklee has moderate resistance to Fusarium head blight (FHB, caused primarily by Fusarium graminearum Schwabe).

Oklee was derived from the cross ‘2375’/SBF0670, made by the former Pioneer Hi-Bred spring wheat breeding program in the USA. The cultivar 2375 (PI 601477, syn. Pioneer 2375) has the pedigree Olaf/Era/Sugamuxi 68/3/Chris/ND487/Lark and was widely grown in Minnesota during the mid-1990s due to its moderate resistance to FHB. SBF0670 is an unreleased line whose pedigree contains hard red spring lines once prominent in the region including ‘Chris’ (CItr 13751, Heiner and Johnston, 1967), ‘Era’ (CItr 13986, Heiner and McVey, 1971), and ‘Butte’.

The F₂ population producing Oklee was selected for leaf rust (caused by Puccinia triticina Eriks.) and stem rust (caused by Puccinia graminis Pers.: Pers.) resistance in a field planting at St. Paul in 1993. The F₃ generation was advanced by single seed descent in a greenhouse. The selection resulting in Oklee was selected from a single plant in an F₅ headrow in 1994 and this seed was increased in a winter nursery in Arizona during 1994 and 1995. This selection was tested under the experimental designation MN95002 in trials from 1995 through 2000 and following purification as MN95002-A in 2001 and 2002. The purification process was initiated in 1999 when 100 heads from F₅ plants of MN95002 were harvested and grown as individual headrows in a winter increase in Arizona. Eighty of these rows were selected based on uniformity of height among and within rows. All selections were similar for other morphological and seed characteristics. The 80 selections were evaluated for agronomic characteristics, and reaction to Fusarium head blight, leaf rust, and stem rust at St. Paul in 2000. No significant differences in disease reaction were observed among the 80 lines. Nineteen of the 80 selections were discarded due to delayed heading and/or shorter height. Equal amounts of seed from the remaining 61 selections were bulked to form MN95002-A. MN95002-A and MN95002 were evaluated in replicated yield trials in 2001 and 2002. No significant differences (P = 0.05) in grain yield between MN95002 and MN95002-A were identified, although MN95002-A was more uniform for plant height and heading date than MN95002. Off-type plants that are approximately 10 cm taller occur in MN95002-A at a frequency of about 3 in 10 000. Approximately 1000 kg of Breeder seed (Reg. no. CV-963, PI 634553) were produced for sale to the public.

In 35 Minnesota trials conducted from 1996 through 2000, Oklee yielded 3664 kg ha⁻¹ compared to 3175 and 3825 kg ha⁻¹ for check cultivars, 2375 and Verde (PI 592561, Busch et al., 1996), respectively. Oklee has relatively early maturing and produces spikes 1.3 d earlier than MN95002. Oklee had lodging ratings of 2.9 and 3.3, respectively. Oklee has strong straw and a lodging rating of 2.3 when scored on a scale of 0 (erect) to 9 (lodged) in 21 environments in the Uniform Regional Wheat Nursery in 1998 and 1999 and yielded 3456 kg ha⁻¹ compared to an average of 3200 kg ha⁻¹ produced by the check cultivars, 2375 and Verde (PI 592561, Busch et al., 1996), respectively. Oklee has strong disease resistance to Septoria tritici, and PYRENOPHORA TRITICICOLA (Died.) Drechs., based on greenhouse assays. Field reactions of the check cultivars, 2375, Oxen, and Verde had lodging ratings of 2.6, and 2.1, respectively.

Oklee has moderate resistance to FHB in national field nursery trials, similar to the resistance of the check cultivars 2375 and Verde evaluated in nurseries from 1998 through 2001, Oklee averaged 7.6% lower in lodged spikes, 16.7% visually scabby kernels (VSK), and 8.8 mg kg⁻¹ of the mycotoxin deoxynivalenol (DON). In the same trials, the resistant check ‘Wheaton’ (PI 469271, Busch et al., 1984) averaged 12.5 mg kg⁻¹ DON. In the same trials, the resistant check cultivar ‘BacUp’ (PI 596533, Busch et al., 1998) averaged 12.5 mg kg⁻¹ DON. In the same trials, the resistant check cultivar ‘BacUp’ (PI 596533, Busch et al., 1998) averaged 12.5 mg kg⁻¹ DON.

Oklee is moderately susceptible in seedling plants to leaf rust (caused by Puccinia triticina Eriks.) and stem rust (caused by Puccinia graminis Pers.: Pers.) resistance in a field planting 8.8 mg kg⁻¹ of the mycotoxin deoxynivalenol (DON). In the same trials, the resistant check ‘Wheaton’ (PI 469271, Busch et al., 1984) averaged 12.5 mg kg⁻¹ DON. In the same trials, the resistant check cultivar ‘BacUp’ (PI 596533, Busch et al., 1998) averaged 12.5 mg kg⁻¹ DON. In the same trials, the resistant check cultivar ‘Wheaton’ (PI 469271, Busch et al., 1984) averaged 12.5 mg kg⁻¹ DON. In the same trials, the resistant check cultivar ‘BacUp’ (PI 596533, Busch et al., 1998) averaged 12.5 mg kg⁻¹ DON.

Oklee was tested as MN95002 and MN95002-A in Minnesota in 2002. Registration of ‘Oklee’’ Wheat was selected from a single plant in an F4 headrow in 1994 and ‘BacUp’ (PI 596533, Busch et al., 1998) and the susceptible check ‘Wheaton’ (PI 469271, Busch et al., 1984) averaged 12.5 mg kg⁻¹ DON. In the same trials, the resistant check cultivar ‘Wheaton’ (PI 469271, Busch et al., 1984) averaged 12.5 mg kg⁻¹ DON. In the same trials, the resistant check cultivar ‘BacUp’ (PI 596533, Busch et al., 1998) averaged 12.5 mg kg⁻¹ DON.
