Get to Know Communities and Divisions

This is the third in a series of informational articles on your member benefits.

Whether you are a new member, or you have been around for a while, our ASA communities and CSSA and SSSA divisions provide structure, programs, and opportunities related to your discipline.

Communities and divisions are the organization of members with common professional interests into groups around topical areas. Their purposes are to encourage scientific exchange and sharing of information, facilitate planning, enhance communication, and provide coordination of programs.

Students and early career members are encouraged to participate in communities and divisions as a means to explore and identify areas of interest.

Communities and divisions will help you develop focused peer networks and information resources while becoming more involved in your Society. They also provide members, especially new members, the opportunity to join a group of active researchers and practitioners who are as excited about a topic area as they are!

Find Out More about Communities and Divisions

Each community and division has a webpage that describes its focus, lists the leadership, and highlights upcoming sessions and symposia. Find out more by visiting:

“Communication is so much more than an email or announcements at a business meeting. It is the work of encouraging and helping members active participants in the programs and affairs of their Society.”

Newell Kitchen, former ASA President and Chair of the ASA Stewardship and Review Committee
