Errata

Effects of Cations on Complexation of Naphthalene by Water-Soluble Organic Carbon

An error was discovered in the above article. The fluorescence lifetime of naphthalene was incorrectly cited as $9.6 \times 10^{-10}$ s. The correct value is $41.7 \times 10^{-8}$ s. This new value and a molecular weight for water-soluble organic carbon of 3500 (the nominal cutoff of the dialysis tubing used in this experiment) provides a revised bimolecular quenching rate of $1.86 \times 10^{11} M^{-1} s^{-1}$. The authors regret any inconvenience caused by the error and thank Dr. Matthew Morra, Department of Plant, Soil, and Entomological Sciences, University of Idaho, for calling it to their attention.

Forum

For Applied Research and Public Policy

Count on the FORUM for balanced, readable coverage of policy-related research in the fields of energy, science and technology, environment, and economic development. With contributors from leading universities, policy centers, government offices, and private corporations, the FORUM promises to cover nationally important environmental issues with a unique blend of perspectives and a dedication to clear communication.

Subscriptions: 1 year (4 issues)
U.S. Foreign
Individuals $24.00 $30.00
Institutions $28.00 $34.00

Send check or Visa or MasterCard information to the FORUM FOR APPLIED RESEARCH AND PUBLIC POLICY, University of North Carolina Press, P.O. Box 2288, Chapel Hill, NC 27515-2288

Authors: Submit articles in triplicate to Editors, FORUM FOR APPLIED RESEARCH AND PUBLIC POLICY, The University of Tennessee, Energy, Environment, and Resources Center, 327 S. Stadium Hall, Knoxville, TN 37996-0710. Call (615) 974-4251 for more information.
