Established Series

DIRT DAUBER SERIES
The Dirt Dauber series consists of deep, coarse, strongly developed, imperfectly to well-trained soils, underlain by the vague hope that their efforts may be useful to someone. They have developed in the school of hard knocks, but realize that the tuition is too high. They are either on the level or gently mopping and occur on all types of terrain at one time or another. On the surface they appear as the ortho of the Homo-Sapiens family, but underneath they exhibit discontinuous streaks of pioneering blood that pushes them on alone to the deepest recesses of the back country despite all obstacles, including high water, snakes, dense vegetation and good fishing holes. Their reaction varies from acid to neutral or even caustic, depending on the weather or the latest word from the brass. Krotovinas are common to this series and occur as the result of their theories being shot full of holes and the voids refilled with materials supplied by soil organisms known as correlators.

(Please continue on back cover)

SOIL SURVEY HORIZONS is a magazine for soil scientists who work close to the auger and the soil. It is these men who are particularly invited to send in good material for publication. Next deadline for copy (4½" wide, single space, elite, new black ribbon for all articles except news-notes, which should be in columns no wider than 3") is Feb. 1.

Subscription Form for SOIL SURVEY HORIZONS, Quarterly Professional Newsletter. Address the Treasurer, F. D. Hole, 203 Soils Bldg., University of Wisconsin, Madison 6, Wisconsin.

Annual rates: Regular, $2.00; Student, $1.00; For, $2.50

Please find enclosed $_____ for ___yr(s) subscription.
