The Analysis of Volume Change in Unconfined Units of Soil

D. McGarry and K. W. J. Malafant

The following corrections should be made:

1. The second paragraph under "c. Normal Zone" on p. 292 should read

Using (ii) implies that \( (d/d\theta_v) V_a = 0 \) and hence in this zone that \( V_a \) is constant. \( K \) is obtained by projecting the normal shrinkage line back to \( \theta_v = 0 \), then \( K \) is that point of intersection of the y-axis such that \( (K - \nu_v) = V_a \). Therefore we have the relationship

\[
\nu = (\nu_v + V_a) + \theta_v. \tag{2}
\]

2. Starting with Eq. [2], p. 292, and continuing through the first column of p. 293, all of the symbols \( K \) should be changed to \( V_a \). This change has already been incorporated in Eq. [2] as listed above.
