Results of Significance Test between Model Pairs

**Brief Description of Figures:** The significance of the difference between the RMSR values obtained by two different models for the estimation of (a) liquid limit, (b) plastic limit, (c) plasticity index are shown in Fig. 1S below. The black squares in these figures represent that the RMSR obtained by the two corresponding models were not significantly different at 95% confidence level; the absence of the black square represents that the RMSR obtained by the two corresponding models were significantly different at 95% confidence level.
